

BioMin™

Armour for Teeth

Case Study

Theresa M^cCarter ^{BSDH, RDH}
California, USA

Patient 1: Elise

This patient is a 28-year-old female. Born prematurely, she had worn orthodontic braces for 7 years and now has sensitivity due to enamel hypoplasia, together with localised recession on several teeth.

She has short roots and white spot lesions were visible on her molars. She has poor home care and suffers from acid plaque.

As an adult, she wears a night guard and has used Sensodyne with Novamin, and Tom's of Maine Rapid Relief for her sensitivity problems, without success. She had tried MI paste containing calcium phosphate but after a short period was not compliant with the treatment.

After using BioMin™ for four months, Elise's sensitivity has reduced dramatically and is now almost non-existent. The enamel is visibly more dense and less translucent on the terminal third of her anterior teeth.

The advantage of BioMin™ is that it is an everyday toothpaste which users can incorporate into their daily routine, encouraging compliance.'

Reported to Moira Crawford, on behalf of BioMin Technologies Limited.
